I successfully installed module PyMySQL using pip

and it shows up in

Code:

```
pip list
```

as

Code:

```
PyMySQL (0.6.2)
```

However, when I try importing it in a script as in

Code:

```
import PyMySQL
```

I get the following error:

Code:

```
ImportError: No module named 'PyMySQL'
```

Is there some kind of path that needs to be set up in order to use this?

Re: Installed PyMySQL using pip but module not found

My mistakes, pip installs only for python2.7 and I was using python3.4, also PyMySQL is the package name but the imported module name is pymysql.

To use package PyMySQL with python3:

Code:

```
sudo apt-get install python3-pip
sudo pip3 install PyMySQL
```
